

At the heart of the CS6 product is an advanced SQL database. Subsequently there are a number of different options open to users of CS6 to generate both simple and sophisticated reports on both the current and historical status of their resources.

CS6 houses standard reports within the software.

Data can be exported to excel or other reporting tools.

Avantex can provide customised reporting suited to the needs of each organisation and their different levels of users.

Report on any of the following...

- Assets** by type, by department, by value, by lifecycle.
- Space** both horizontal in terms of floor space and vertical in terms of cabinet and rack space.
- Capacity** what is your maximum server capacity, how much are you currently using and how long before you run out of space?
- Energy** how much are you using by power rail or by device, what is your power usage efficiency and how has it changed over time?
- Staff** track work orders, know who has changed what, when and where by day of week and time of day.
